Your Architectural Kata is...

Going Going Gone!

An auction company wants to take their auctions online to a nationwide scale--customers choose the auction to participate in, wait until the auction begins, then bid during the live auction as if they were there in the room, with the auctioneer.

- **Users:** scale up to hundreds of participants (per auction), potentially up to thousands of participants, and as many simultaneous auctions as possible
- **Requirements:**
 - bidders can see a live video stream of the auction and see all bids as they occur
 - auctions must be as real-time as possible
 - both online and live bids must be received in the order in which they are placed
 - bidders register with credit card; system automatically charges card if bidder wins
 - participants must be tracked via a reputation index
- **Additional Context:**
 - auction company is expanding aggressively by merging with smaller competitors
 - if nationwide auction is a success, replicate the model overseas
 - budget is not constrained--this is a strategic direction
 - company just exited a lawsuit where they settled a suit alleging fraud

Your Architectural Kata is...

Silicon Sandwiches

A national sandwich shop wants to enable internet-ordering (in addition to their current call-in service)

- ***Users:*** thousands, perhaps one day millions
- ***Requirements:***
 - users will place their order, then be given a time to pick up their sandwich and directions to the shop (which must integrate with several external mapping services that include traffic information)
 - if the shop offers a delivery service, dispatch the driver with the sandwich to the user
 - mobile-device accessibility
 - offer national daily promotions/specials
 - offer local daily promotions/specials
 - accept payment online or in person/on delivery
- ***Additional Context:***
 - Sandwich shops are franchised, each with a different owner.
 - Parent company has near-future plans to expand overseas.
 - Corporate goal is to hire inexpensive labor to maximize profit.
 - Time to market is critical.

First Law of Software Architecture:

Everything in software
architecture is a tradeoff.

First Law of Software Architecture:
Everything in software
architecture is a tradeoff.

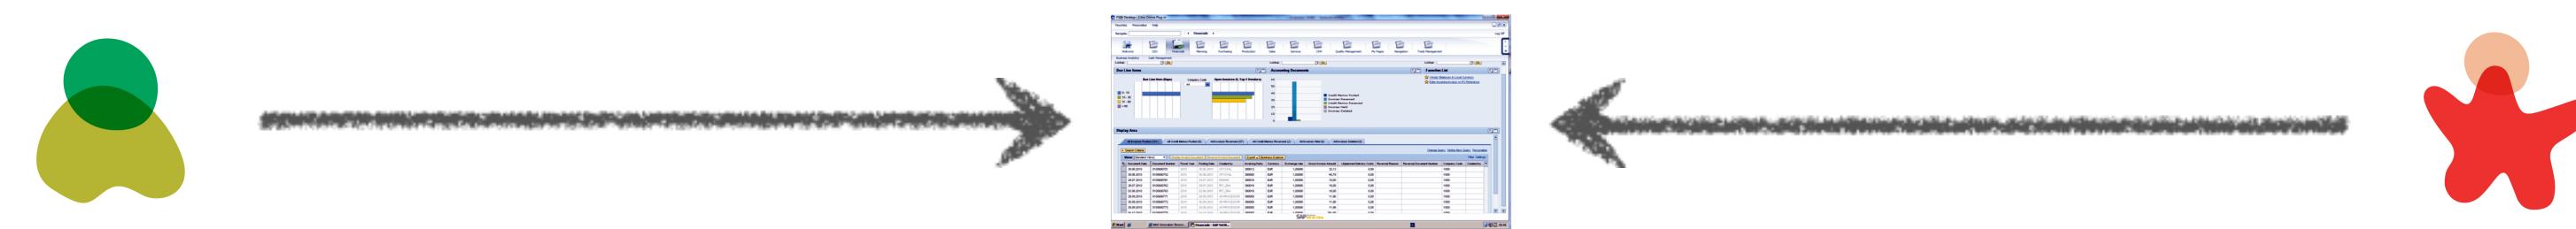

First Corollary:

If you think you've found something
that *isn't* a tradeoff, it just means you
haven't identified the tradeoff...yet.

A national sandwich shop wants to enable 'fax in your order' but over the Internet instead (in addition to their current fax-in service)

- **Users:** thousands, perhaps one day millions
- **Requirements:**
 - users will place their order, then be given a time to pick up their sandwich and directions to the shop (which must integrate with several external mapping services that include traffic information)
 - if the shop offers a delivery service, dispatch the driver with the sandwich to the user
 - mobile-device accessibility
 - offer national daily promotional specials
 - offer local daily promotional specials
 - accept payment online or in person/on delivery
- **Additional Context:**
 - Sandwich shops are franchised, each with a different owner.
 - Parent company has near-future plans to expand overseas.
 - Corporate goal is to hire inexpensive labor to maximize profit.

Going Going Gone!

An auction company wants to take their auctions online to a nationwide scale--customers choose the auction to participate in, wait until the auction begins, then bid during the live auction as if they were there in the room, with the auctioneer.

- **Users:** scale up to hundreds of participants (per auction), potentially up to thousands of participants, and as many simultaneous auctions as possible
- **Requirements:**
 - bidders can see a live video stream of the auction and see all bids as they occur
 - auctions must be as real-time as possible
 - both online and live bids must be received in the order in which they are placed
 - bidders register with credit card; system automatically charges card if bidder wins
 - participants must be tracked via a reputation index
- **Additional Context:**
 - auction company is expanding aggressively by merging with smaller competitors
 - if nationwide auction is a success, replicate the model overseas
 - budget is not constrained--this is a strategic direction
 - company just exited a lawsuit where they settled a suit alleging fraud

An auction company wants to take their auctions online to a nationwide scale--customers choose the auction to participate in, wait until the auction begins, then bid during the live auction as if they were there in the room, with the auctioneer.

- **Users:** scale up to hundreds of participants (per auction), potentially up to thousands of participants, and as many simultaneous auctions as possible
- **Requirements:**
 - bidders can see a live video stream of the auction and see all bids as they occur
 - auctions must be as real-time as possible
 - both online and live bids must be received in the order in which they are placed
 - bidders register with credit card; system automatically charges card if bidder wins
 - participants must be tracked via a reputation index
- **Additional Context:**
 - auction company is expanding aggressively by merging with smaller competitors
 - if nationwide auction is a success, replicate the model overseas
 - budget is not constrained--this is a strategic direction
 - company just exited a lawsuit where they settled a suit alleging fraud

Your Architectural Kata is...

Going Going Gone!

1. Separate Queues for Bid Streamer and Tracker Services

Status

Accepted

Context

The Bid Capture Services, upon receiving a bid, must forward that bid to the Bid Streamer Service and the Bidder Tracker Service. This could be done using a single topic (pub/sub) or separate queues (p2p) for each service.

Decision

We will use separate queues for the Bid Streamer and Bidder Tracker services.

Multiple bids will come in for the same ask amount. The Streamer service only needs the first bid received for that amount, whereas the Bidder Tracker needs all bids received. Using a topic (pub/sub) would require the Bid Streamer to contain logic to ignore bids that are the same as the prior amount, forcing the Bid Streamer to store shared state between instances.

The Bid Streamer Service stores the bids for an item in an in-memory cache, whereas the Bidder Tracker stored bids in a database. The Bidder Tracker will therefore be slower and might require back pressure. Using a dedicated Bidder Tracker queue provides this dedicated back pressure point.

Consequences

This decision will require the Bid Capture services to send the same information to multiple queues.

Use of Micro-kernel Architecture

Status
PROPOSED

Context

Two key requirements of the system (_promotions_ and _location services_) have both global (affects all stores) and local (specific to location) requirements.

The current design features a modular monolith architecture, allowing individual stores to upload their behavior using JAR files, shown in *Figure 1*.

![modular monolith](fig1_modular_monolith.jpg)
 Figure 1: the current state architecture

Currently, stores must specify custom behavior (product specials, promotions, location exemptions) via a JAR file, uploaded to the global site via FTP. Operations must certify the JAR, leading to delays in deploying new features.

All local customizations reside in one service and in one set of tables in the master database.

To allow stores to most easily add and customize local behavior, the architects propose moving to a micro-kernel architecture, shown in *Figure 2*.

![microkernel architecture](fig2_microkernel.jpg)
 Figure 2: proposed microkernel architecture

The new design allows easy update of global policy (products, inventory, promotions) while allowing local stores to selectively those choices when appropriate.

Decision

The architects decided to migrate the current monolith to become the core system for the new microkernel architecture, and build new functionality via plug-ins.

Consequences

The architects take advantage of the restructuring opportunity to localize databases to individual domains.

The new design also incorporates the BFF patterns, discussed in [004 BFF for device independence](#).

The new design will greatly improve the customization workflow.

- the local store plug-in architecture certifies customizations automatically
- promotions within threshold values go live within 15 minutes
- all stores work with generic workflows via the core system
- promotions
- location exemptions
- local products

Use of Micro-kernel Architecture

Status

PROPOSED

Context

Two key requirements of the system (*promotions* and *location services*) have both global (affects all stores) and local (specific to location) requirements. The current design features a modular monolith architecture, allowing individual stores to upload their behavior using JAR files, shown in *Figure 1*.

Figure 1: the current state architecture

Currently, stores must specify custom behavior (product specials, promotions, location exemptions) via a JAR file, uploaded to the global site via FTP. Operations must certify the JAR, leading to delays in deploying new features.

All local customizations reside in one service and in one set of tables in the master database. Over time, as new customizations accrued, it has become a tangled mess.

To allow stores to most easily add and customize local behavior, the architects propose moving to a micro-kernel architecture, shown in *Figure 2*.

Figure 2: proposed microkernel architecture

The new design allows easy update of global policy (products, inventory, promotions) while allowing local stores to selectively those choices when appropriate.

Decision

The architects decided to migrate the current monolith to become the core system for the new microkernel architecture, and build new functionality via plug-ins.

Consequences

The architects take advantage of the restructuring opportunity to localize databases to individual domains. Communication between services now occurs via messaging.

The new design also incorporates the BFF patterns, discussed in [004 BFF for device independence](#).

The new design will greatly improve the customization workflow.

- the local store plug-in architecture certifies customizations automatically
- promotions within threshold values go live within 15 minutes
- all stores work with generic workflows via the core system, but locations can override to create custom behavior for:
 - promotions
 - location exemptions
 - local products

Architectural Katas Architectural Katas Fundamentals of Software Architecture List of
Architecture Katas

Architectural Katas

inspired by Ted Neward's original [Architectural Katas](#)

"How do we get great designers?
Great designers design,
of course."
Fred Brooks

"So how are we supposed to get great architects, if
they only get the chance to architect fewer than
a half-dozen times in their career?"
Ted Neward

About

Architectural Katas are intended as a small-group (3-5 people) exercise, usually as part of a larger group (4-10 groups are ideal), each of whom is doing a different kata. A Moderator keeps track of time, assigns Katas (or allows this website to choose one randomly), and acts as the facilitator for the exercise.

Each group is given a project (in many ways, an RFP—Request For Proposal) that needs development. The project team meets for a while, discovers requirements that aren't in the original proposal by asking questions of the "customer" (the Moderator), discusses technology options that could work, and sketches out a rough vision of what the solution could look like. Then, after they've discussed for a while, the project team must present their solution to the other project teams in the room, and answer challenges (in the form of hard-but-fair questions) from the other project teams. Once that challenge phase is done, the room votes on their results, and the next project team takes the floor.

Rules

Doing an Architectural Kata requires you to obey a few rules in order to get the maximum out of the activity. [Read Rules »](#)

Rules

The rules are broken down by the different Phases of the exercise. However, one rule trumps all the others: **Any other questions that are not already covered by these rules, you may ask the Moderator about.** When in doubt, ask.

Preparation: Getting your project team together

The first step is to assemble your project team. There are only a few rules regarding the composition

Developer to Architect

Training and resources for the journey from software developer to software architect
Mark Richards, Software Architect and Founder

Software Developer To Software Architect

"The journey from developer to software architect is a difficult and uncharted path filled with lots of challenges, pitfalls, and confusion. The purpose and goal of DeveloperToArchitect.com is to provide resources and training to help you along the journey to becoming an effective software architect"

Mark Richards, Software Architect, Founder of DeveloperToArchitect.com

I created this website to provide developers with resources and guidance in the long and difficult journey from software developer to software architect. In here you'll find helpful lessons, articles, books, videos, source code, and training classes I teach.

Software Architecture Monday is a free bi-weekly video lesson series on some aspect of software architecture. These 10 minute YouTube videos contain various aspects of application, integration, and enterprise architecture.

Contact Me

To contact me regarding any public and private software architecture training classes I offer, you can reach me (Mark Richards) directly at info@developertoarchitect.com

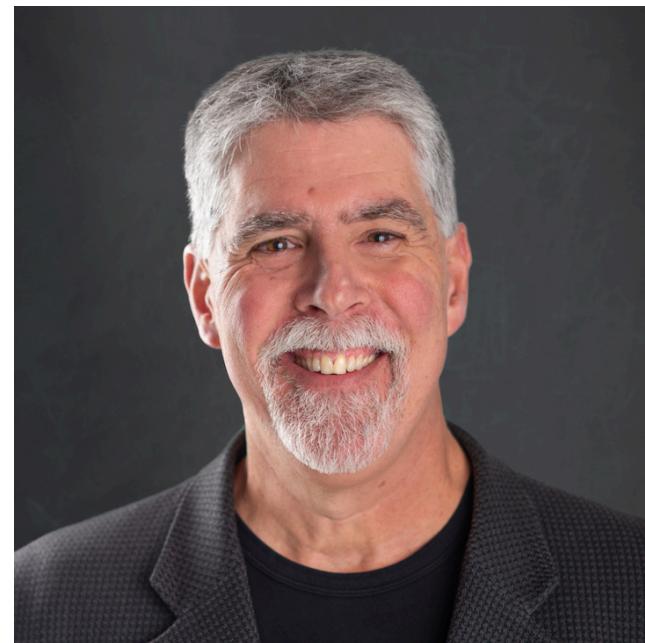

Public Live Virtual Training

I'm excited to announce that during our current social situation I am conducting live, hands-on virtual workshops. See my [Training](#) page and [Upcoming Events](#) page for a complete listing of classes, details, dates, and how to register.
